Let $M(t)$ be the amount of a product that decreases with time t and the rate of decrease is proportional to the amount M as follows $dM/dt = -kM$ where dM/dt is the first derivative of M , $k > 0$ and t is the time. Solve the above first order differential equation to obtain $M(t) = A e^{-kt}$ where A is non zero constant.

An ordinary differential equation (ODE) is an equation containing an unknown function of one real or complex variable x , its derivatives, and some given functions of x . The unknown function is generally represented by a variable (often denoted y), which, therefore, depends on x . Thus x is often called the independent variable of the equation. The term "ordinary" is used in contrast with the term ...

A novel approach for designing the feedback control based on past states is proposed for hybrid stochastic differential equations (SDEs). This new theorem builds up the connection between the delay feedback control and the control function without delay terms, which enables one to construct the delay feedback control using the existing results on stabilities of hybrid SDEs.
