The bootstrap method is a resampling technique used to estimate statistics on a population by sampling a dataset with replacement. It can be used to estimate summary statistics such as the mean or standard deviation. It is used in applied machine learning to estimate the sk of machine learning models when making predictions on data not included in the training data.

Das Bootstrapping-Verfahren oder Bootstrap-Verfahren (selten Münchhausenmethode) ist in der Statistik eine Methode des Resampling. Dabei werden wiederholt Statistiken auf der Grundlage lediglich einer Stichprobe berechnet. Verwendung finden Bootstrap-Methoden, wenn die theoretische Verteilung der interessierenden Statistik nicht bekannt ist. Diese Methode wurde erstmals von Bradley Efron 1979 ...

2 Introduction. The empirical bootstrap is a statistical technique popularized by Bradley Efron in 1979. Though remarkably simple to implement, the bootstrap would not be feasible without modern computing power. The key idea is to perform computations on the data itself to estimate the variation of statistics that are themselves computed from the same data. That is, the data is 'pulling ...

History. The bootstrap was published by Bradley Efron in "Bootstrap methods: another look at the jackknife" (1979), inspired by earlier work on the jackknife. Improved estimates of the variance were developed later. A Bayesian extension was developed in 1981. The bias-corrected and accelerated (BCa) bootstrap was developed by Efron in 1987, and the ABC procedure in 1992.
