Chemotherapy affects all cells that grow and divide quickly in the body. This includes cancer cells and normal cells, such as the new blood cells in the bone marrow or the cells in the mouth, stomach, skin, hair and reproductive organs. When chemotherapy damages normal cells, this causes side effects.

[Medical Marijuana and Cancer - WebMD](#)

Cancer is a group of diseases involving abnormal cell growth with the potential to invade or spread to other parts of the body. These contrast with benign tumors, which do not spread. Possible signs and symptoms include a lump, abnormal bleeding, prolonged cough, unexplained weight loss, and a change in bowel movements. While these symptoms may indicate cancer, they can also have other causes.
